		Suryodaya College of Engineering and Technology Rashtrasant Tukadoji Maharaj Nagpur University, Nagpur Maharashtra, India “Man-Machine Interaction Using Double Channel Electrooculogram (EOG) Signals” Abstract:- Electrooculography (EOG/E.O.G.) is a technique for measuring the cornea-retinal standing potential that exists between the front and the back of the human eye. To measure eye movement, pairs of electrodes are typically placed either above and below the eye or to the left and right of the eye. If the eye moves from center position toward one of the two electrodes, this electrode “sees” the positive side of the retina and the opposite electrode “sees” the negative side of the retina. Consequently, a potential difference occurs between the electrodes. Assuming that the resting potential is constant, the recorded potential is a measure of the eye’s position. The bio-potential signal also is one of the examples of human-machine interface using of nonverbal information such as electrooculography (EOG), electromyography (EMG), and electroencephalography (EEG) signals. The EOG and EMG signals are physiological changes; but here we are focusing the mainly on EOG signals for the human-machine interface. This Project has investigated that different EOG signals obtained from four different places around eye; (right, left, up, and down) have led to different level of distance and rotation of prototype toy car. Those four signals are correspond to different levels of right and left steer, forward and backward motion. Name:-Pankaj Rahise Branch:- Electronics and Telecommunication Year:- Final Remarks: I have personally seen this innovation it is really useful to the society. Needs more R&D for its application into developing various devices. Hope that this innovation would change and ease lives of many. Congratulations <i>[Signature]</i>
